## Homework 2 (due 3/9)

1. The Euclidean transformations $t_{1}$ and $t_{2}$ are given by

$$
t_{1}(\mathbf{x})=\left(\begin{array}{cc}
\frac{3}{5} & -\frac{4}{5} \\
\frac{4}{5} & \frac{3}{5}
\end{array}\right) \mathbf{x}+\binom{1}{-2}
$$

and

$$
t_{2}(\mathbf{x})=\left(\begin{array}{cc}
-\frac{4}{5} & \frac{3}{5} \\
\frac{3}{5} & \frac{4}{5}
\end{array}\right) \mathbf{x}+\binom{-2}{1} .
$$

Determine the composite $t_{2}^{-1} \circ t_{1}$.
2. Write down an example (if one exists) of each type of transformation $t: \mathbb{R}^{2} \rightarrow \mathbb{R}^{2}$ described below. In each case, justify your answer.
(a) An affine transformation $t$ which is not a Euclidean transformation
(b) A Euclidean transformation $t$ which is not an affine transformation
(c) A transformation $t$ which is both Euclidean and affine
(d) A transformation $t$ which is one-to-one, but is neither Euclidean nor affine
3. Determine the affine transformation which maps the points $(1,1),(3,2)$ and $(4,1)$ to the points $(0,1),(1,2)$ and $(3,7)$, respectively.
4. Determine the equation of the image of the parabola $P$ with equation $y=x^{2}$ under the affine transformation $t: \mathbb{R}^{2} \rightarrow \mathbb{R}^{2}$ given by

$$
t(\mathbf{x})=\left(\begin{array}{cc}
1 & 0 \\
-2 & 1
\end{array}\right) \mathbf{x}
$$

Show the image of the vertex of $P$ is not the vertex of $t(P)$. (This proves that the property of "being a vertex of a parabola" is not an affine property.)
